What is a thermal energy storage system?

Thermal Energy Storage (TES) systems are accumulators that store available thermal energy to be used in a later stage when consumption is required or when energy generation is cheaper. A TES tank reduces the operational cost and the required capacity of the Cooling and Heating plants, increasing the efficiency and reducing the capital cost.

How does a chilled water storage tank work?

When charging the tank, the warm water is taken from the top of the tank and sent to the chiller, while the chilled water is returned to the tank near the bottom. Chilled water storage tanks require a large footprint to store the large volume of water required for these systems.

How does a chiller system work?

A secondary loop that feeds chilled water to the air handler coils. And the last piece is to add in the thermal energy storage tank tied into the primary chilled water loop. The system can run using just the chillers, or the chiller could be run at night to charge the storage tank when electrical rates are cheaper.

What does a chiller plant do?

At the end of the peak demand period, the chiller plant is used to replenish the ice in the storage tanks as well as provide the required chilled water to the facility process cooling loads and HVAC cooling loads between 6 pm and 6 am.

What is a model C thermal energy storage tank?

The second-generation Model C Thermal Energy Storage tank also features a 100 percent welded polyethylene heat exchanger and improved reliability, virtually eliminating maintenance. The tank is available with pressure ratings up to 125 psi.

What are thermal energy storage strategies?

There are two basic Thermal Energy Storage (TES) Strategies, latent heat systems and sensible heat systems. Stratification is used within the tank as a strategy for thermal layering of the stored water. Colder water is denser and will settle toward the bottom of the tank, while the warmer water will naturally seek to rise to the top.

Thermal energy storage technologies encompass ice harvesting, external melt ice-on-coil, internal melt ice-on-coil, encapsulated ice, stratified water and multi-tank. These technologies have ...
