How do I connect my solar panels to my solar charge controller?

Now, there are probably going to be 2 types of wires connecting your solar panels to your solar charge controller: PV or USE-2 type wires connecting your solar panels to the combiner box or pass-through box. These are referred to as PV source wires.

How do I connect a PV array to a solar charge controller?

Connecting the PV Array to the Solar Charge Controller These will be labeled as 'PV Array', 'Solar Panels', or 'Panel'. Again, pay close attention to the indicated polarities. Once more, match the polarity. The positive wire goes to the positive solar panel terminal, and the negative wire connects to the negative terminal.

How do I size the wires between solar panels & solar charge controller?

To size the wires between your solar panels and solar charge controller correctly, you'll need to make sure that the ampacity of each wire is at least 1.25 greater than the maximum current going through the wire, and that the total voltage drop between your solar panels and solar charge controller does not exceed 3%.

How to wire solar panels together?

Wiring solar panels together can be done with pre-installed wires at the modules, but extending the wiring to the inverter or service panel requires selecting the right wire. For rooftop PV installations, you can use the PV wire, known in Europe as TUV PV Wire or EN 50618 solar cable standard.

What are the different types of solar panels wires & connectors?

When wiring solar panels, there are very specific types of cables and connectors that you'll need to get the job done successfully. These include: PV Wire or Solar Cable: These are used to interconnect the solar panels which we have also referred to as stringing.

How do you wire solar panels in series?

Wiring solar panels in series involves connecting each panel to the next in a line (as illustrated in the diagram above). Just like a typical battery that you may be familiar with, solar panels have positive and negative terminals.
