Do solar panels need a power inverter?

Houses are wired to operate on alternating current (AC) power. Every photovoltaic solar energy system for use with household electricity requires a way to transform the direct current (DC) energy created by the solar panels to AC power. The power inverter your home's solar energy array requires will depend on several factors.

How does a solar panel work?

The solar process begins with sunshine, which causes a reaction within the solar panel. That reaction produces a DC. However, the newly created DC is not safe to use in the home until it passes through an inverter which turns it from DC to AC. Also known as a central inverter. Smaller solar arrays may use a standard string inverter.

Does a solar inverter use AC?

Almost all household appliances such as fridges, wifi routers and TV's run on alternate current (AC), however. Solar inverters convert the direct current (DC) energy from a solar panel into alternate current (AC) energy appliances use. It's also important to note that solar batteries store DC energy.

How do string inverters work?

What they do: Power optimizers are a good way to give a string inverter system a bit of a boost. They're installed on the back of every solar panel, and they improve the quality and stability of the DC power from each individual solar panel. The power optimizers then send that power to the string inverter, which converts it to AC power.
