

# Lithium facts periodic table

In fact, they are the most reactive metals and, along with the elements in group 17, are the most reactive of all elements. The reactivity of alkali metals increases from the top to the bottom of the group, so lithium (Li) is the ...

The most reactive include lithium, potassium, and radium, whereas those of low reactivity are gold, silver, palladium, and platinum. The high electrical and thermal conductivities of the simple metals (i.e., the non-transition metals ...

Today, we have 118 elements in the periodic table, each unique and fascinating. So, how many elements in the periodic table now? Answer: 118 confirmed elements as of 2025. The first ...

The seven elements--helium, neon, argon, krypton, xenon, radon, and oganesson--of Group 18 of the periodic table. All of the noble gases are present in Earth's atmosphere and are colorless, odorless, tasteless, and ...

Transition metal, any of various chemical elements that have valence electrons--i.e., electrons that can participate in the formation of chemical bonds--in two shells instead of only one. They occupy the middle portions of ...

The periodic properties of elements are closely related to their electronic configuration and exhibit a gradual change as we move down a group or across a period. Key physical properties such as melting points, boiling ...

Cesium, chemical element of Group 1 (also called Group Ia) of the periodic table, the alkali metal group, and the first element to be discovered spectroscopically (1860), by German scientists Robert Bunsen and Gustav ...

The worksheet has all the electronic configurations of every element. Firstly, the users must know how many elements are in the periodic table. For those users who don't know how many elements are there, so for ...
