

Solar system quiz

What is the largest planet in the solar system?

Earth is the largest terrestrial planet and the only known planet that has life on it. It is the 3rd planet from the sun with a mean distance of around 1 AU. It travels around the sun with a speed of 29.78 km/sec and completes one orbit in 365.24 earth days. The magnetosphere of the earth protects us from harmful solar and cosmic winds.

What is the smallest planet in the solar system?

The biggest planet in the solar system by volume and mass is Jupiter while the smallest is Mercury. The best way to measure the size of something is by estimating its volume and how much matter it has. What Is the Mass and Size of Mercury? With a mean radius of 3031.67 miles, Mercury is the smallest of all the planets in the solar system.

Who are some scientists that have helped us learn about the solar system?

We know now that the earlier thoughts are not true, and through the finding of scientists such as Galileo and Copernicus, we've learned so much about the solar system. Planets other than earth have oceans, volcanoes and mountains.

How many planets are in the solar system?

The Solar System includes four terrestrial planets (composed of rock and metal) and four gas giants (gaseous material). The four terrestrial planets are Mercury, Venus, Earth, and Mars, and the four gas giants are Jupiter, Saturn, Uranus, and Neptune. These names are derived from Roman gods and goddesses.

Nitpick: Dwarf planets are not a type of planet, but in fact a wholly separate category. From Wikipedia: "In 2006 the concept was adopted by the International Astronomical Union (IAU) as a category of sub-planetary objects, part of a three-way recategorization of bodies orbiting the Sun: planets, dwarf planets and small Solar System bodies.
