What is a distributed wind energy installation?

A distributed wind energy installation is defined by its technology application, not its size, and is typically smaller than 20 MW. This type of installation is explained in this animation and illustrates how a turbine at a residential home can offset its energy usage.

What is a distributed wind system?

Distributed wind systems use wind energy to produce clean, emissions-free power for homes, farms, schools, and businesses. [LEARN MORE](#). A group of large wind turbines in the same location used to produce electricity.

What is the distributed wind market?

The distributed wind market includes wind turbines and projects of many sizes, from small wind turbines on private land providing less than 1 kilowatt (kW) of energy to multi-megawatt wind farms that power campuses or large facilities.

What is a small residential wind turbine?

Small wind turbines for residential use, also known as distributed wind turbines, can be used in residential settings to directly offset electricity usage. They are typically in the 1- to 10-kW range and can be larger. With net metering, power that is not used by the home is credited to the customer as it flows back onto the electricity system.

How big is a wind turbine?

Wind turbines used in offshore wind energy can be even larger than on land, with towers one-and-a-half-times the height of the Washington Monument and blades as long as a football field (as noted in the U.S. Department of Energy's list of 10 things you may not have known about wind energy).

What is a distributed wind farm?

It includes a utility-scale wind farm, connected by transmission lines to a city with homes, farms, and a school. The animation explains how wind can be used at all of these interconnected locations. Distributed wind systems use wind energy to produce clean, emissions-free power for homes, farms, schools, and businesses. [LEARN MORE](#).
