

Wind Power Station Transfer Agreement

Does a wind energy land agreement include co-location?

In one sense, virtually every Wind Energy Land Agreement contemplates co-location of different operations: the wind farm use and the continuing underlying use by the landowner of the property outside the project facility footprint.

How do wind energy land agreements work?

Wind Energy Land Agreements can take many forms. A developer will usually develop its own preferred form consistent with its business model, the laws of the particular state (s) and jurisdictions in which it operates, and pricing and operating assumptions.

Can a landowner retain rights to a wind energy facility?

If a landowner seeks simply to retain the rights to revenue from wind energy facilities on property to be transferred, the landowner should work closely with counsel to ensure that what they want to do is lawful, allowed under and consistent with their Wind Energy Land Agreement, and clearly documented on the record.

How can a landowner control a wind energy project?

An effective way to gain this control is to encumber enough property to construct, operate, and protect the project and its wind resource and to include noninterference covenants in the Wind Energy Land Agreement that limit the landowner's right to interfere with the wind flow over the property.

What is a wind energy lease & easement agreement?

The tool for capturing this value typically is a wind energy lease or easement agreement that creates and protects a developer's interest and investment in the property and project, and provides reliable income to the landowner, while offering the developer the flexibility to transfer all or portions of the project over its lifetime.

How does a wind energy land agreement affect a developer?

For a developer, having to track and deal with changing and increasing numbers of persons holding or claiming some interest in the underlying project lands or right to payments from the Wind Energy Land Agreement can be time-consuming and contentious, and can expose the developer to multiple competing claims and increased risk.

The turbine supply agreement (TSA) is a critical component of the contractual framework for both onshore and offshore wind farms. This note analyses some of the key aspects of a TSA and how it fits into the wider ...

ION Part A is required for commissioning of any dynamic reactive compensation equipment for export of reactive power. ION Part B is required for first export of active power from the wind farm. The customer will be issued with a ...
